The cache database records all data structures that are used to record properties, actions, and their current states of all components in the system. The cache database is also used to track dependencies among components, and any dependencies among actions. The cache database is needed to record a list of components and to validate actions. If there are no changes to the cache database, the system generates an error message and the installation stops. To avoid the system error message, the user must manually clean the cache database. The cache database can be removed manually or automatically. In a manual method, the user removes the database files from the Files directory, such as c:\program files (x86)\Microsoft Corporation\Windows\Installer, then the installer starts again. In an automatic method, the installer adds the database files in the Install/Uninstall folder, such as c:\program files (x86)\Microsoft Corporation\Windows\Installer\Installs, and then the installer starts again. To remove the cache database automatically, the user removes the folder. This is a Microsoft SQL Server installer package file that installs Microsoft SQL Server 2016.
